## LIST OF CURRENT CLAIMS

## 1-2. (Canceled)

(Currently Amended) An oxygen enrichment apparatus comprising:
a main body having an oxygen enriching unit for generating oxygen-enriched
air;

a suction unit for suctioning the oxygen-enriched air from the oxygen enriching unit;

a discharge unit for discharging the oxygen-enriched air from the suction unit; and

a control unit for controlling the operation of the suction unit,

wherein the oxygen enriching unit has at least one oxygen enriching membrane for generating the oxygen-enriched air and a condensed water treating unit is installed at an air passage for guiding the oxygen-enriched air from the oxygen enriching unit to the discharge unit via the suction unit,

wherein a fan is installed in the main body for supplying air around the oxygen enriching membrane, and the oxygen enriching membrane is of a substantially rectangular shape, a short side thereof being disposed substantially parallel to a direction of flow of the air supplied by the fan.

4. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein the air passage for guiding the oxygen-enriched air from the oxygen enriching unit to the discharge unit is partially comprised of a flexible connection tube and the oxygen-enriched air is guided via the flexible connection tube to the discharge unit to be discharged therefrom.

## 5-6. (Canceled)

- 7. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein the discharge unit is detachably installed to the oxygen enrichment apparatus.
- 8. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a cover is detachably mounted on the discharge unit.

9. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a sterile filtration filter and/or an HEPA (High Efficiency Particulate Air) filter is installed at the discharge unit.

- 10. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein the control unit has a timer means for controlling an operation time period during which the oxygen-enriched air is generated.
- 11. (Currently Amended) The apparatus of claim [[2 or]] 3, wherein the control unit controls a flow rate of the oxygen-enriched air to be about 1.5 liters per minute or greater and sets a timer means such that an operation time of the suction unit is about 1 hour or less.
- 12. (Original) The apparatus of claim 3, wherein the condensed water treating unit is implemented by allowing air other than the oxygen-enriched air to be introduced into the air passage of the oxygen-enriched air.
- 13. (Original) The apparatus of claim 12, wherein the air passage of the oxygen-enriched air is provided with an air inlet via an air passage conversion unit.
- 14. (Original) The apparatus of claim 3, wherein air other than the oxygen-enriched air is introduced into the air passage of the oxygen-enriched air, and the control unit controls the apparatus to perform an oxygen-enriched air generating operation for a time period to discharge the oxygen-enriched air from the discharge unit and then to execute a ventilating operation for a period of time to discharge the air other than the oxygen-enriched air from the discharge unit.
- 15. (Original) The apparatus of claim 3, wherein air other than the oxygen-enriched air is introduced into the air passage of the oxygen-enriched air; the control unit controls the apparatus to perform an oxygen-enriched air generating operation for a time period to discharge the oxygen-enriched air from the discharge unit; a stand-by stage during which the discharge unit stops operating is provided between the oxygen-enriched air from the oxygen-enriched air generating unit; a stand-by stage during which the discharge unit stops operating is provided between the oxygen-enriched air generating unit; a stand-by stage during which the discharge unit stops operating is provided between the oxygen-enriched air generating unit stops operating is provided between the oxygen-enriched air generating unit stops operating is provided between the oxygen-enriched air generating unit stops operating is provided between the oxygen-enriched air generating unit stops operating unit stops operating is provided between the oxygen-enriched air generating unit stops operating is provided between the oxygen-enriched air generating unit stops operating unit stops oper

enriched air generating operation and the ventilating operation; and a ventilating operation is then performed for a period of time to discharge the air other than the oxygen-enriched air from the discharge unit.

- 16. (Original) The apparatus of claim 3, wherein air other than the oxygen-enriched air is introduced into the air passage of the oxygen-enriched air, and if an operation stop signal is provided to the control unit during the oxygen-enriched air generating operation, the control unit changes an operation of the apparatus from an oxygen-enriched air generating operation mode to a stand-by stage mode, a ventilating operation mode and a stop mode in that sequence.
- 17. (Original) The apparatus of claim 3, wherein air other than the oxygen-enriched air is introduced into the air passage of the oxygen-enriched air, and a heating unit is installed in an air passage for introducing the air other than the oxygen-enriched air.
- 18. (Original) The apparatus of claim 3, further comprising a humidity detecting unit for measuring ambient humidity and wherein air other than the oxygenenriched air is introduced into the air passage of the oxygen-enriched air and the control unit controls the apparatus to perform an oxygen-enriched air generating operation for a time period to discharge the oxygen-enriched air from the discharge unit and then to execute a ventilating operation for a period of time to discharge the air other than the oxygen-enriched air from the discharge unit, and the control unit varies the period of time for the ventilating operation time according to information provided from the humidity detecting unit.
- 19. (Original) The apparatus of claim 3, further comprising a measuring unit for measuring a time during which the oxygen-enriched air generating operation is carried out and wherein air other than the oxygen-enriched air is introduced into the air passage of the oxygen-enriched air and the control unit controls the apparatus to perform an oxygen-enriched air generating operation for a time period to discharge the oxygen-enriched air from the discharge unit and then to execute a ventilating operation for a period of time to discharge the air other than the oxygen-enriched air

from the discharge unit, and the control unit varies the period of time for the ventilating operation according to information provided from the measuring unit.

- 20. (Original) The apparatus of claim 3, wherein the condensed water treating unit is a liquid collecting unit provided at the air passage of the oxygenenriched air.
- 21. (Original) The apparatus of claim 3, wherein a part of the air passage is a communicating tube connected to the discharge unit and wherein a liquid collecting unit is separably installed at the communicating tube.
- 22. (Original) The apparatus of claim 3, wherein a part of the air passage is a communicating tube connected to the discharge unit; a liquid collecting unit is installed at the communicating tube; a body of the liquid collecting unit is divided into a plurality of parts; and water gathered in the liquid collecting unit is removed by separating the parts.
- 23. (Currently Amended) The apparatus of claim 3, wherein a part of the air passage is a communicating tube connected to the discharge unit; a liquid collecting unit is installed at the communicating tube; a body of the liquid collecting unit is divided into a plurality of parts; the liquid collecting unit has a tube protruded thereinto; and water gathered in the liquid collecting unit is removed by separating the parts.
- 24. (Original) The apparatus of claim 3, wherein a water absorbent material or a drying agent serving as the condensed water treating unit is provided at the air passage of the oxygen-enriched air.
- 25. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein the discharge unit is provided with a discharge port, an opening area of the discharge port being smaller than that of an air outlet port of the suction unit from which the oxygen-enriched air is outputted.

Art Unit: 1797

26. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a water tub is installed at the air passage between the oxygen enriching unit and the discharge unit and the oxygen-enriched air is discharged from the discharge unit after passing through the water tube tub.

- 27. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a water tub is installed at the air passage between the oxygen enriching unit and the discharge unit and the oxygen-enriched air is discharged from the discharge unit after passing through the water tube, and Zn or a Zn compound is provided in the water tub.
- 28. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a silencer is installed in the air passage of the oxygen-enriched air.
- 29. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein an aroma supplying unit for adding aroma to the oxygen-enriched air is installed at the air passage of the oxygen-enriched air.
- 30. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, further comprising an anion generator, wherein anions generated by the anion generator are mixed with the oxygen-enriched air and discharged from the discharge unit.
- 31. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein anti-bacterial material and/or an anti-static material is provided in the air passage from the oxygen enriching unit to the discharge unit.
- 32. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein an AC power for driving the suction unit is supplied by converting a DC power thereinto.

Art Unit: 1797

33. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a secondary battery is used as a power source for driving the suction unit and the control unit.

34. (Currently Amended) The apparatus of any one of claims claim [[1 to]] 3, wherein a secondary battery is used as a power source for driving the suction unit and the control unit, and a DC power source and the secondary battery are alternatively employed as the power source of the suction unit and the control unit.
